One of the fascinations of psychiatry is that it is amenable to many different approaches. In seeking to account for mental disorder, for example, it is possible to explore the meaning and significance of symptoms in the psychodynamic sense, to examine the social determinants of illness, or to adopt an essentially biological viewpoint in investigating links between physiological and psychological dysfunction. As a clinical discipline it may be practiced in the community, in the specialized clinic or hospital, or shoulder-to-shoulder with other medical practitioners in the general hospital. This richness and diversity are at once a strength and a weakness, attracting practitioners with a wide range of talents and interests, yet sometimes leading to polarizations and false antitheses. The so-called "medical model" of psychiatry has come under a good deal of attack, and deservedly so when claiming an exclusive provenance over all types and aspects of mental disorder. What cannot be gainsaid, however, is the central role of medicine in relation to many parts of the field, and the success in terms of understanding and therapy that has resulted from medicine's involvement. Nor can it be doubted, after the most cursory acquaintance with the physically or mentally ill, that the relationship between these two forms of suffering is often so close and so mutually reinforcing that distinctions are drawn somewhat arbitrarily. This last is perhaps the cardinal reason for the alliance between medicine and psychiatry.

This book provides an innovative and comprehensive overview of the relationship between lung and exercise, both in healthy, active subjects and in subjects with chronic respiratory diseases. It investigates in detail the central role of the lungs during exercise and illustrates the impact of respiratory impairment due to both acute and chronic lung diseases on performance. Further, the book presents the latest evidence-based findings, which confirm that exercise is an effective and safe form of prevention and rehabilitation in respiratory diseases. The first section describes the changes in the respiratory system during exercise and the contribution of respiration to exercise, while readers will learn how to perform a respiratory assessment in the second section. The third section addresses a broad range of chronic respiratory diseases and the (in)ability of those affected to play sports and perform exercise, thus providing a basis for individual assessments. The last two sections focus on respiratory training, rehabilitation and the relationship between respiration and the environment, e.g. in high-altitude and underwater sports. The book will appeal to a wide readership, including pulmonologists, sport medicine physicians, physiotherapists and trainers, as well as instructors and students in exercise science.
